

# RAXC

Retrieval - Augmented - eXploit - Checker

**Vibe coders** ship fast, **Hackers** move faster.  
**RAXC** finds the exploits before they do.

## DeFi Exploit Losses by Year

474 confirmed exploits - 4.1B total - Average 11.2M per incident

# The Problem

**Same 4 patterns. Every year. Still no fix.**

- **Reentrancy** - steal funds before state updates
- **Price Manipulation** - fake oracle / spot price abuse
- **Access Control** - missing onlyOwner checks
- **Flash Loans** - borrow → drain → repay in one tx

**Existing tools all fail at different points:**

- **Static analyzers** - false positives, miss novel patterns
- **Human auditors** - \$50K+, weeks of turnaround
- **ChatGPT / Claude** - hallucinate, no real exploit grounding
- **On-chain monitors** - detect after deploy, already too late

**No tool combines real exploit evidence with pre-deployment analysis**

# How RAXC works

# Competitive Landscape

## Competitive Landscape

Why existing tools are not enough — and why RAXC is different

| Tool / Platform     | Approach                                      | Gap                                         |
|---------------------|-----------------------------------------------|---------------------------------------------|
| Slither, MythX      | Static analysis — rule-based pattern matching | Misses novel patterns, high false positives |
| Code4rena, ImmuneFi | Human auditors                                | \$50K+ cost, weeks of turnaround            |
| ChatGPT / Claude    | Generic LLM knowledge                         | Hallucinations, no real exploit grounding   |
| Forta Network       | Real-time on-chain monitoring                 | Detects after deployment, not before        |
| Cyfrin Aderyn       | Open-source static analysis                   | No LLM, no exploit database                 |
| Audit Wizard        | LLM-assisted audit UI                         | No RAG, no real exploit retrieval           |
| + RAXC              | RAG + Real Exploits + GPT-4o                  | 🔍 Solves all gaps above                     |

RAXC is the only tool combining: real exploit POC corpus · semantic vector search · RAG-grounded LLM analysis

# Revenue model

# Roadmap

## RAXC Product Roadmap

Phase 1 (POC) complete · Phases 2-6 funded by grant

# Grant for RAXC

## \$30,000 to Prevent the Next \$1.8B Loss

*\$30K grant · 12-month runway · working product in 4 weeks*

| Item                  | Scope                                                        | Amount          |
|-----------------------|--------------------------------------------------------------|-----------------|
| OpenAI API            | Embeddings + GPT-4o (12 months)                              | \$600           |
| Qdrant Cloud          | Vector DB production (12 months)                             | \$300           |
| Development — Phase 2 | UI + LangGraph pipeline + ERC4626 vault                      | \$20,000        |
| Development — Phase 3 | CI/CD + API endpoint + dataset expansion                     | \$9,100         |
| <b>TOTAL</b>          | <b>12-month infrastructure + Phase 2 &amp; 3 development</b> | <b>\$30,000</b> |

### What gets delivered

- + Working web app (4 weeks)
- + 726+ exploits indexed in Qdrant
- + ERC4626 vault live on Avalanche C-Chain
- + CI/CD GitHub Action for contract scanning
- + Public API endpoint for third-party integrations

*ROI: Each prevented exploit saves \$30K-\$400M+ · RAXC costs cents per scan · \$30K is cheap insurance*
